I got into web development as a personal interests since my first year of college, although I graduated BE in electrical engineering. The first couple years of my coding was mostly self-taught with various resources online. It was fun and productive in a way, but I wasn't satisfy enough due to the lack of in dept understanding of what I was doing.

I found Launch School and I liked their idea of journey to mastery, the concept of the school is to encourage students be able to understand the code itself, acknowledge the core fundamental of web development, focus to the language itself and consider technology as a tool to the language. I had been in the program for a little more than one year, then I decided to switch my career, after working as an electrical engineer for 4 and a half years.

On my early years before Launch School, I had a chance to contribute to "Sticky Rice Mag" a non-profit community driven online magazine which I helped with graphic design, web development and initial launching. Also, I had taken some freelance work with designing and coding for a personal blog, restaurant websites and content management system for friends, family and some of my colleagues.

I have experience in developing web application using Ruby with Sinatra, NodeJS with ExpressJS, one of the my recent project is Music Store app, which is a single page application e-commerce store using NodeJS and ExpressJS on the back-end, with BackboneJS rendering on the front-end, augment with Pug, handlebarsJS, Stylus, Grunt and Bower to enhance user experience as well as reduce server requests.

Currently, I'm working on implementing my Todo App project with multiple framework such as Angular 2, Angular 4, React, Vue, Ember, and Meteor. I had built Todo App with vanilla Javascript version, JQuery version and BackboneJS version in the past. The simplicity function of Todo App would help me understand each characteristic and behavior of each framework, moreover differentiated the strength of each individual tool which fits for a certain type of project. The project will be running with Node and Express with multiple routes to individual framework.

I like to code daily, and will continue doing so. I hope that we could have a chance to meet and be considered if my expertise would bring any addition to the team.

If I'm not what you are looking for, I would be appreciate should we keep connect via Linkedin, as in the future as I grow, I hope we have a chance to work together.

Best Regards
Paul Kuttiya
